CHAPTER-1

INTRODUCTION

1.1 INTRODUCTION

In a modern generation Online food ordering is a mobility of food delivery or takeout from a food box. This is made possible through the use of electronic payment system. It is possible for everyone to order any goods from anywhere the internet and have the goods delivered at his/her home. the necessary tool for this process telecommunication with customers. The system will become an important tools use for restaurant to improve the management aspect by use of computer system to connected each and every food ordering transaction instead of data record on it. In addition, it can also provide efficiency for the restaurant by reducing time consuming, minimize human errors or delivery and providing good quality and service to customers.

The project has been planned to be having the view of distributed architecture, with centralized storage of the database. The application for the storage of the data has been planned. Using the constructs of MySQL Database and all the user interfaces have been designed using the Angular & Spring boot technologies. The database connectivity is planned using the “MySQL Connection” methodology. The standards of data protective mechanism have been given a big choice for proper usage. The application takes care of different modules and their associated reports, which are produced as per the applicable strategies and standards that are put forwarded by the administrative staff.

CHAPTER-2

SYSTEM ANALYSIS

2.1.ANALYSIS MODEL

The model that is basically being followed is the WATER FALL MODEL, which states that the phases are organized in a linear order. First of all, the feasibility study is done. Once that part is over the requirement analysis and project planning begins. If system exists one and modification and addition of new module is needed, analysis of present system can be used as basic model. The design starts after the requirement analysis is complete and the coding begins after the design is complete. Once the programming is completed, the testing is done. In this model the sequence of activities performed in a software development project are: -

- Requirement Analysis
- Project Planning
- System design
- Detail design
- Coding
- Unit testing
- System integration & testing

Here the linear ordering of these activities is critical. End of the phase and the output of one phase is the input of other phase. The output of each phase is to be consistent with the overall requirement of the system. Some of the qualities of spiral model are also incorporated like after the people concerned with the project review completion of each of the phase the work done.

WATER FALL MODEL was being chosen because all requirements were known beforehand and the objective of our software development is the computerization/automation of an already existing manual working system.

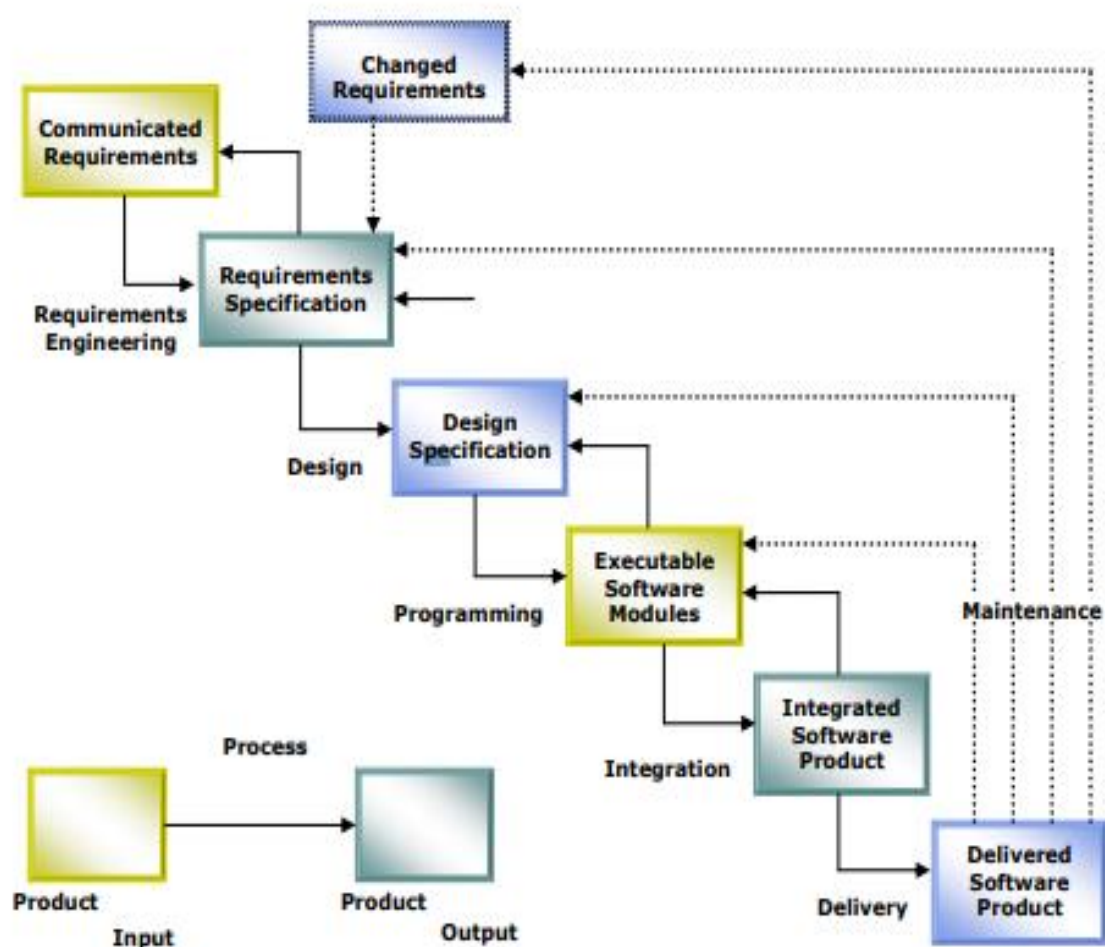

Fig: Water Fall Model

NUMBER OF MODULES

The system after careful analysis has been identified to be presented with the following modules:

The modules involved are:

- Food box
- Authentication
 - Login
 - Registration
- View food items
 - Admin
 - User
- Cart
- Contact us
- About us

CHAPTER -3

Requirement Analysis

3.1 Requirement Analysis

Software Requirements

- Apache tomcat server 0.9
- Application Server
- Visual Studio
- MySQL
- Spring boot Tool Suit
- Hibernate/JPA

Hardware requirements

- Operating System - Windows XP, Windows 7, Windows 10 or above
- Processor - Intel Dual Core or higher version RAM - Minimum 2GB or above
- Hard Disk - Minimum 40GB or above

CHAPTER -4

Software Design

4.1 Introduction for Software Design

Software design sits at the technical kernel of the software engineering process and is applied regardless of the development paradigm and area of application. Design is the first step in the development phase for any engineered product or system. The designer's goal is to produce a model or representation of an entity that will later be built. Beginning, once system requirement has been specified and analysed, system design is the first of the three technical activities - design, code and test that is required to build and verify software.

The importance can be stated with a single word "Quality". Design is the place where quality is fostered in software development. Design provides us with representations of software that can assess for quality. Design is the only way that we can accurately translate a customer's view into a finished software product or system. Software design serves as a foundation for all the software engineering steps that follow. Without a strong design we risk building an unstable system – one that will be difficult to test, one whose quality cannot be assessed until the last stage.

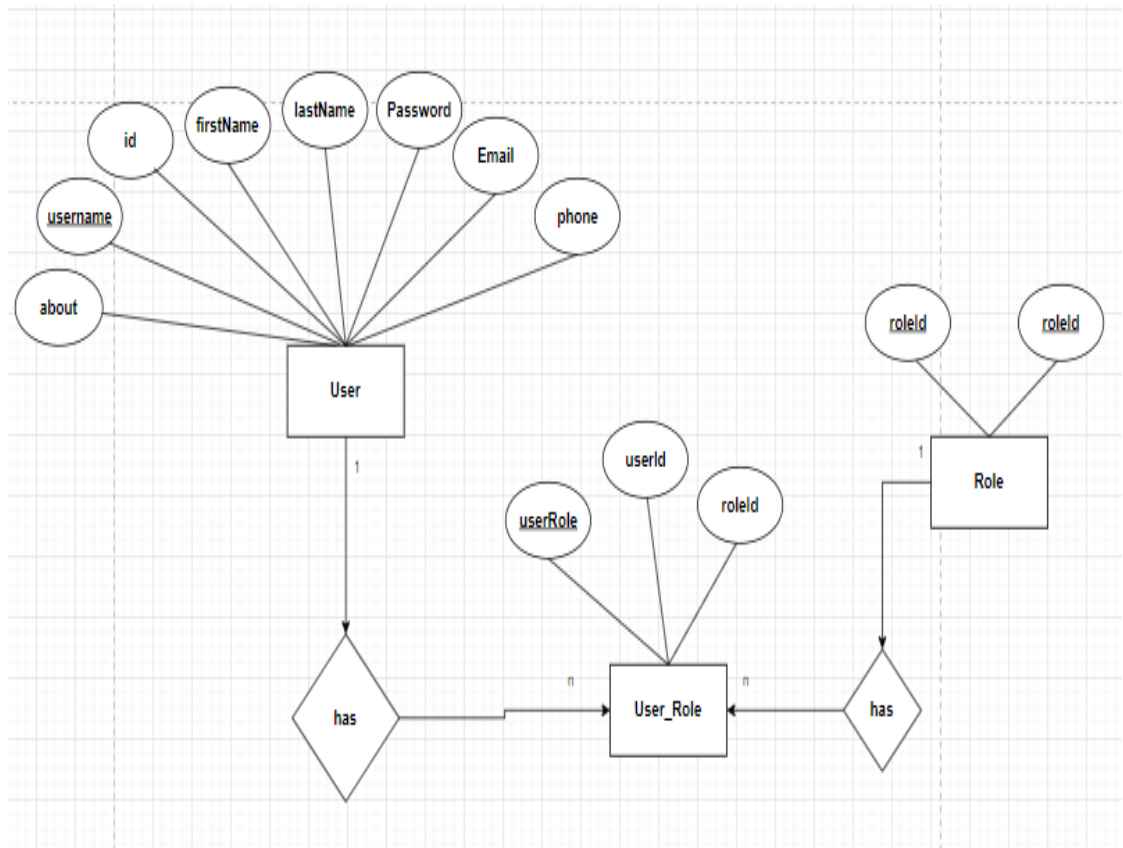

During design, progressive refinement of data structure, program structure, and procedural details are developed reviewed and documented. System design can be viewed from either technical or project management perspective. From the technical point of view, design is comprised of four activities – architectural design, data structure design, interface design and procedural design.

Database User page

The screenshot shows a database management interface. On the left is a 'SCHEMAS' navigator with a tree view containing 'employee_jobportal' and 'foodbox'. The 'foodbox' schema is expanded, showing tables like 'contact', 'hibernate_sequence', 'roles', 'user_role', and 'users'. The main window has a tab for 'contact' with the SQL query 'SELECT * FROM foodbox.contact;'. Below the query is a 'Result Grid' showing the data from the 'contact' table.

CHAPTER-8

Future Enhancement

Future enhancement

- This System being web-based and an undertaking of Cyber Security Division, needs to be thoroughly tested to find out any security gaps.
- A console for the data centre may be made available to allow the personnel to monitor on the sites which were cleared for hosting during a particular period.
- Moreover, it is just a beginning; further the system may be utilized in various other types of auditing operation viz. Network auditing or similar process/ workflow based applications...

CHAPTER-9

Conclusion

9.1 Conclusion

Online Food Ordering system is done to help and solve one of the important problems of customer. Because Large number of customer can use the internet and phone. Various issues related to Mess/Tiffin Service will be solved by these system. Thus, implementation of Online Food Ordering system is done to help and solve one of the important problems of customer. It helps customer in making order easily and gives information needed in making order to customer place. The Food website application made for restaurant massive one help to receiving order

BENEFITS:

To evaluate the way of interaction with customers.

✓ To develop a restaurant ordering system with mobile application based on the client server application.

✓ To determine the factors that influence customer when ordering food online.

✓ To computerized the food ordering system process and display details of sales history

LIMITATIONS:

- The size of the database increases day-by-day, increasing the load on the database back up and data maintenance activity.
- Training for simple computer operations is necessary for the users working on the system.
